abstract

Patients in need of a stem cell transplant often rely on unrelated donors. Canadians can register as donors online or at a stem cell drive by providing consent and a tissue sample for typing. To the knowledge of this author, no guidelines have been published to recommend a process for stem cell donor recruitment at drives. This article outlines an evidence–based approach to stem cell drive organization with five core components: prescreening, informed consent, registration, swabbing, and reconciliation. This approach offers guidance to medical students who coordinate stem cell drives and encourages them to act as health advocates for Canadians who need a stem cell transplant.

introduction

Patients with a variety of blood cancers and metabolic diseases may require a stem cell transplant as part of their treatment. However, 70% of patients do not have a suitable genetic match in their family. Canada’s stem cell donor database, OneMatch Stem Cell and Marrow Network, is used to match potential unrelated donors to patients worldwide. Individuals aged 17–35 years can register online or at a stem cell drive where they provide consent and a tissue sample (buccal–swab) for Human Leukocyte Antigen (HLA) allele typing. However, due to the overwhelming number of possible HLA allele combinations, it remains challenging to secure a compatible stem cell donor for many patients: currently, over 1000 Canadians are unable to find a match anywhere in the world.

To address the need for stem cell donor registrants, I founded the UBC Stem Cell Club in 2011. As of June 2014, the club has coordinated 21 stem cell drives in a variety of settings including drives on six university campuses across BC, in the community, and in rural areas. Altogether, we have recruited over 2300 donors, representing 2.5% of all registrants recruited across Canada between 2012 and 2014. We have gained considerable experience operating stem cell drives, and we are accredited by OneMatch to run drives independently.

Registrants must be at least 17 years old as this is the age required to provide consent. Individuals older than age 35 are not eligible to register as studies have shown that a younger donor age is associated with improved outcomes, including increased survival rates, in the transplant recipient. This evidence has guided OneMatch to focus recruitment efforts toward younger donors. Individuals registering to be stem cell donors also need to be in good general health. This requirement seeks to protect volunteer donors from the risk of damage to their own health and to protect recipients from transmissible diseases. Registrants also need to have

Ineligible registrants should be redirected to help in other ways; they could be encouraged to donate blood if able, to ask their peers, friends, and family to consider registering as stem cell donors, and to volunteer at stem cell drives.
Table 1: Five Stations necessary for a stem cell drive

<table>
<thead>
<tr>
<th>Station</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Prescreening</td>
<td>Recruits individuals to consider registering as potential donors</td>
</tr>
<tr>
<td></td>
<td>Ensures donor eligibility</td>
</tr>
<tr>
<td></td>
<td>Targets the most-needed donors</td>
</tr>
<tr>
<td>2. Informed consent</td>
<td>Ensures that donors are informed about:</td>
</tr>
<tr>
<td></td>
<td>• Stem cell donation principles and procedures</td>
</tr>
<tr>
<td></td>
<td>• Risks and side effects of donation</td>
</tr>
<tr>
<td></td>
<td>• Anonymity, confidentiality, and right to withdraw from the registry</td>
</tr>
<tr>
<td>3. Registration</td>
<td>Guides registrants to complete necessary paperwork</td>
</tr>
<tr>
<td></td>
<td>Answers registrant questions</td>
</tr>
<tr>
<td>4. Swabbing</td>
<td>Guides registrants to swab their cheeks for a tissue sample</td>
</tr>
<tr>
<td></td>
<td>Assembles and seals completed swab kits</td>

In addition to confirming that potential registrants meet minimum eligibility criteria to sign up, volunteers at the pre-screening station should actively target the most-needed stem cell donors: donors that are young, male, and ethnically diverse.

Interested potential donors who meet the minimum eligibility requirements outlined above should be directed to an informed consent station. Informed consent is a moral, ethical, and legal requirement to become a stem cell donor. In addition, studies have shown that individuals are more likely to be ambivalent towards donating if they feel less informed or have unanswered questions at the time of recruitment. Such individuals are more likely to withdraw from the registry if asked to proceed with the donation. Informed consent includes notifying the registrant of all relevant procedures, as well as possible risks of donation, right to withdraw, and confidentiality and anonymity of the program.

Informed consent

To sign up as a stem cell donor in Canada, registrants must complete a form that asks for demographic information (including ethnic background), contact information, and medical history. Registrants then sign their consent to join the registry. At this station, volunteers should be available to guide registrants through forms and answer any questions that may arise. It is important that registrants provide detailed contact information, including alternate contacts, so they can be contacted if they are a match.

Recruitment of ethnically-diverse donors is important as patients are more likely to find a genetic match from donors within their own ethnic community.
Stem cell drives directly improve the Canadian stem cell donor database, an important global health resource that helps patients worldwide.

I founded the UBC Stem Cell Club in 2011. As of June 2014, the club has coordinated 21 stem cell drives in a variety of settings including drives on six university campuses across BC, in the community, and in rural areas. Altogether, we have recruited over 2300 donors, representing 2.5% of all registrants recruited across Canada between 2012 and 2014.

reconciliation

The final station of a stem cell drive is reconciliation. Here, registrants should be given another opportunity to ask questions. Drive organizers should inform registrants that they will remain on the registry until age 60. Registrants may also be called by OneMatch staff to confirm any details on their paperwork. They should be told that they are responsible for updating their address if necessary. This allows OneMatch to contact them if they are found to be a suitable match. The last step of the stem cell drive is error checking with the registrant. Errors can prevent completed swab kits from being entered into Canada's stem cell donor database. The process of redoing registration paperwork and/or cheek swabs can delay processing and testing; this can result in a delay for a patient and a matched donor. Finally, kits are processed and recorded for shipping and drive outcomes are tallied.

conclusion: stem cell drives and health advocacy

Stem cell drives directly improve the Canadian stem cell donor database, an important global health resource that helps patients worldwide. Coordinating or volunteering at drives represents a meaningful avenue for individuals to act as health advocates for over 1000 Canadians who are in need of a transplant but cannot find a match. The five–station approach to stem cell drive organization outlined here represents a model for effective stem cell donor recruitment.

acknowledgements

The author would like to acknowledge OneMatch Stem Cell and Marrow Network for their partnership, training, supplies, and support as well as the UBC Stem Cell Club executive team and volunteers—at all four distributed sites of the UBC Medical Program—for their efforts in coordinating stem cell drives and recruiting potential donors. The UBC Stem Cell Club is funded by the Canadian Federation of Medical Students (CFMS), Doctors of BC, and the UBC Medical Undergraduate Society.
